About Standing Seam

It's a roofing system that consists of vertical metal panels connected to each other through raised seam. The interlocking metal panels create a solid structure that enables roof movement under thermal expansion or contraction. Continuing vertical panels decrease the risk of leaking.

Snap Lock Standing Seam

Benefits

- Modern look
- Exceptional durability and longevity
- Improved attic ventilation system
- Truly green building material

beauty doesn't have to fade

Coated steel has four layers of coat:

1. Steel base is coated with a zinc layer on both sides. Zinc coating protects the steel from corrosion.
2. Pre-treatment layer is applied to improve the corrosion resistance.
3. Primer layer is used for corrosion protection and adds a good adhesion to the top coat.
4. Top coat is the layer that gives the final product its color.
